

Mouse Scale is a purely driver-focused startup created by a single driver. So far, none of the carriers have given us a single dollar for research and digitization of the load control industry. We will strive to develop associated transportations using trucks with half-empty trailers.

We will develop information support for associated transportations once we have 100,000 users. Therefore, we ask truck drivers for their financial support. Purchase a “Kings of American Roads” license for \$100, and you will receive a \$300 credit to use our information services to find associated transportations. We will create a network of truck drivers who will be able to track the movement of half-empty trucks and their weight parameters.

Obviously, carriers have to cover the costs of software, licenses, and Mouse Scale equipment for drivers, because these are business expenses.

Without financial support, the idea of ride-sharing for trucks with half-empty trailers may remain unimplemented for a long time until we raise the necessary funds.

What your funding will go towards:

1. Creating a Scan-a-Weight program for automatic reading of truck and trailer GAUGE data using a smartphone camera
2. Developing a mouse scale program for the on-board computers of the trucks themselves.
3. Development of ride-sharing (like Uber for half-empty trucks).
4. Lobbying for changes to the laws on front axle weight limits for trucks.
5. Conducting research on optimizing fuel consumption depending on equipment and load distribution between axles.
6. Patent protection of technology from competitors.
7. Conducting information work with OEM truck and trailer manufacturers to create the world's best load control system based on smartphone and on-board computers .

Support Mouse Scale and everything will be fine because we work to help you earn more and return home alive and unharmed.
